

Restaurant Overview Dashboard – Star Restaurant Identification & Recommendation System

Introduction

This project analyzes restaurant data to identify star restaurants and generate data-driven recommendations.

Problem Statement

To analyze restaurant performance using ratings, votes, cost, cuisines, online delivery and booking features.

Datasets Used

- Restaurant dataset
- Country code dataset

Data Cleaning

- Removed duplicates
- Handled null values
- Validated country codes

Exploratory Data Analysis

- Restaurant distribution analysis
- Online delivery and booking trends
- Customer voting behavior

Cuisine Analysis

Top cuisines include North Indian, Chinese, Fast Food, Cafe and Bakery.

Cost vs Rating

Higher price range restaurants show better average ratings.

Star Restaurant Criteria

- High ratings
- High votes
- Online delivery
- Table booking

Dashboard Components

- KPI indicators
- World map distribution
- Rating vs votes scatter plot
- Cost vs rating bar chart
- Top 10 cuisines

Key Insights

- India has the highest restaurant density
- Delivery boosts engagement
- Quality improves with price range

Conclusion

The dashboard effectively identifies star restaurants and supports strategic business decisions.

Tools Used

Tableau, Python, Excel

Future Enhancements

- ML-based recommendations
- Review sentiment analysis
- Live data integration
